HCL Leap

Lightweight Enterprise Apps

PRODUCTS & PLATFORMS
by HCL Technologies

BUILD CUSTOM WEB APPLICATIONS IN MINUTES!

HCL Leap lets non-technical users (and technical too!) easily create sophisticated web applications for data collection and process automation. Applications are designed without writing code through a simple drag and drop interface. When you deploy your application HCL Leap automatically creates its runtime which includes forms, database, reports, charts, API, rules, notifications, security and workflow.

EASY TO CHANGE

Applications designed with HCL Leap can be easily changed to accommodate changing business requirements so you can be more responsive to customer and market needs. Design changes can be made without interrupting the existing runtime or data collected. When design changes are complete they can be redeployed to automatically update the application runtime – all without any downtime for your users.

FEATURES

CLOUD-STYLE DEPLOYMENT

Deploy a single software instance for all your users. Apps and data are secure and only accessible by those who created them and any others who they elect to have access. All use of the software is through your browser or mobile device.

SIMPLE WORKFLOW

Speed the approval process with flexible, role-based workflow and access control. You can automatically generate email notifications, invoke services at workflow steps and provide a dynamic experience based on rules.

ADAPTIVE BEHAVIOR

Applications you create can run on mobile devices and all the popular desktop browsers. Forms will adapt how they render to take advantage of the devices they are being used on.

EVERYTHING YOU NEED

Design apps and make changes to existing apps in your browser. Deploy them and send out the url. No need to worry about the database and reports and charts as these are all automatically generated.

FLEXIBLE INTEGRATION

Integrate data from existing systems to pre-populate fields and feed back-end systems with information you collect. The software's service architecture lets you define connections with just about any connection.

EXTENSIBLE

Apps can be quickly customized using standard web development skills. Styles can be modified through CSS, functions added as HTML fragments and JavaScript can be used with the software's comprehensive API and events.

EXAMPLE APPLICATIONS

ISSUE AND RESOLUTION TRACKING

Move off of email and to a system where you can effectively capture and track resolution.

CUSTOMER CHANGE REQUESTS

Provide customers with an efficient self-service approach for requesting changes.

SUPPLY CHAIN CERTIFICATION

Improve quality with consistent supplier monitoring and inspection

HEALTHCARE TRACKING

Deliver improved care with information collected on the progress of your patients

BUSINESS REQUESTS

Eliminate manual processes by providing employees with an automated way to get what they need.

CUSTOMER ACQUISITION

Enroll prospective customers in programs and coordinate the follow up

EMPLOYEE ONBOARDING

Efficiently bring new talent into the team to help your business deliver
